## Summary

---

This report summarises the operations and data acquired during the 2022 drop down video (DDV) survey of maerl habitats within the Fal and Helford Special Area of Conservation (SAC). The survey was carried out over three days, on the 12<sup>th</sup> May 2022, 1<sup>st</sup> June 2022 and 13<sup>th</sup> July 2022.

The aim of the survey was to collect high-quality video and still imagery from 25 survey sites within the SAC to verify acoustic signatures from side-scan imagery collected by Cornwall Inshore Fisheries and Conservation Authority (IFCA) in 2021 (Sturgeon *et al.*, 2021). One additional site was added during the survey. Video and stills imagery were successfully collected from 26 survey sites.

## 1 Background and Introduction

---

Cornwall Inshore Fisheries and Conservation Authority (Cornwall IFCA) carried out a survey between May and July in 2022 of the maerl feature of the Fal and Helford Special Area of Conservation (SAC). The aim of the survey was to get a better understanding of the varying types of maerl habitats present including: dense maerl (live and dead or dead), maerl sediment (live and dead or dead), sparse maerl (live and dead), scattered maerl (live and dead), maerl veneer (live and dead, static or live and dead, mobile) and areas of potential maerl which lack detail, and to provide an updated extent and distribution map within the Fal and Helford SAC. There were two parts to this survey and the current report details the second part. The first part consisted of an initial side-scan sonar survey in the Fal and Helford SAC, which was carried out by Cornwall IFCA in 2020 and 2021 (Sturgeon *et al.*, 2021). The initial survey gathered acoustic data within the SAC, focusing on Falmouth Bay and covered an area from Pendennis Point to the Helford River out to the Fal and Helford SAC boundary from Zone Point towards Manacle Point (Figure 1). This second part uses the acoustic data gathered in part one to identify transitions between different acoustic signatures, with the aim of verifying habitat types represented by the given acoustic signals, using drop down video and stills, and is reported below and in Jenkin *et al.*, 2023.

The survey was carried out to provide additional information in respect of the distribution of differing maerl habitats within Falmouth Bay. The results will aid in the finalisation of the Habitats Regulations Assessment (HRA) which is investigating the impact of potting on maerl, a designated feature of the Fal and Helford SAC. The purpose of the HRA is to ascertain whether the fishing activity, in this instance potting, has an effect equivalent to a Likely Significant Effect (LSE), or an Adverse Effect on Integrity (AEOI) of, the feature/ sub-features of the SAC. The outcome of the HRA will determine whether management measures are required in order to ensure that the assessed fishing activity, or activities, will have no adverse effect on the integrity of the SAC. Cornwall IFCA currently considers the likelihood of the activity (potting) occurring within the live maerl bed habitat is possible and the risk to the sensitive maerl habitat is medium and required more evidence to define the areas of live maerl within the Fal and Helford SAC.

The HRA is part of the revised approach to the management of commercial fisheries in European Marine Sites (EMS), that the Department for Environment, Food and Rural Affairs (Defra) announced in 2012. The objective of the revised approach was to ensure that all existing and potential commercial fishing activities were managed in accordance with Article 6 of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora, the ‘Habitats Directive’. The marine aspects of the Habitats Directive (Council Directive 92/43/EEC) were transposed to domestic law in the Conservation of Habitats and Species Regulations 2017.

The revised approach was implemented on an evidence based, risk-prioritised, and phased basis. Risk prioritisation is informed by using a matrix of the generic sensitivity of the sub-features of EMS, to a suite of fishing activities, as a decision making tool. These sub-feature/activity combinations have been categorised according to specific definitions, as red, amber, green or blue (high, medium, low or no risk respectively).

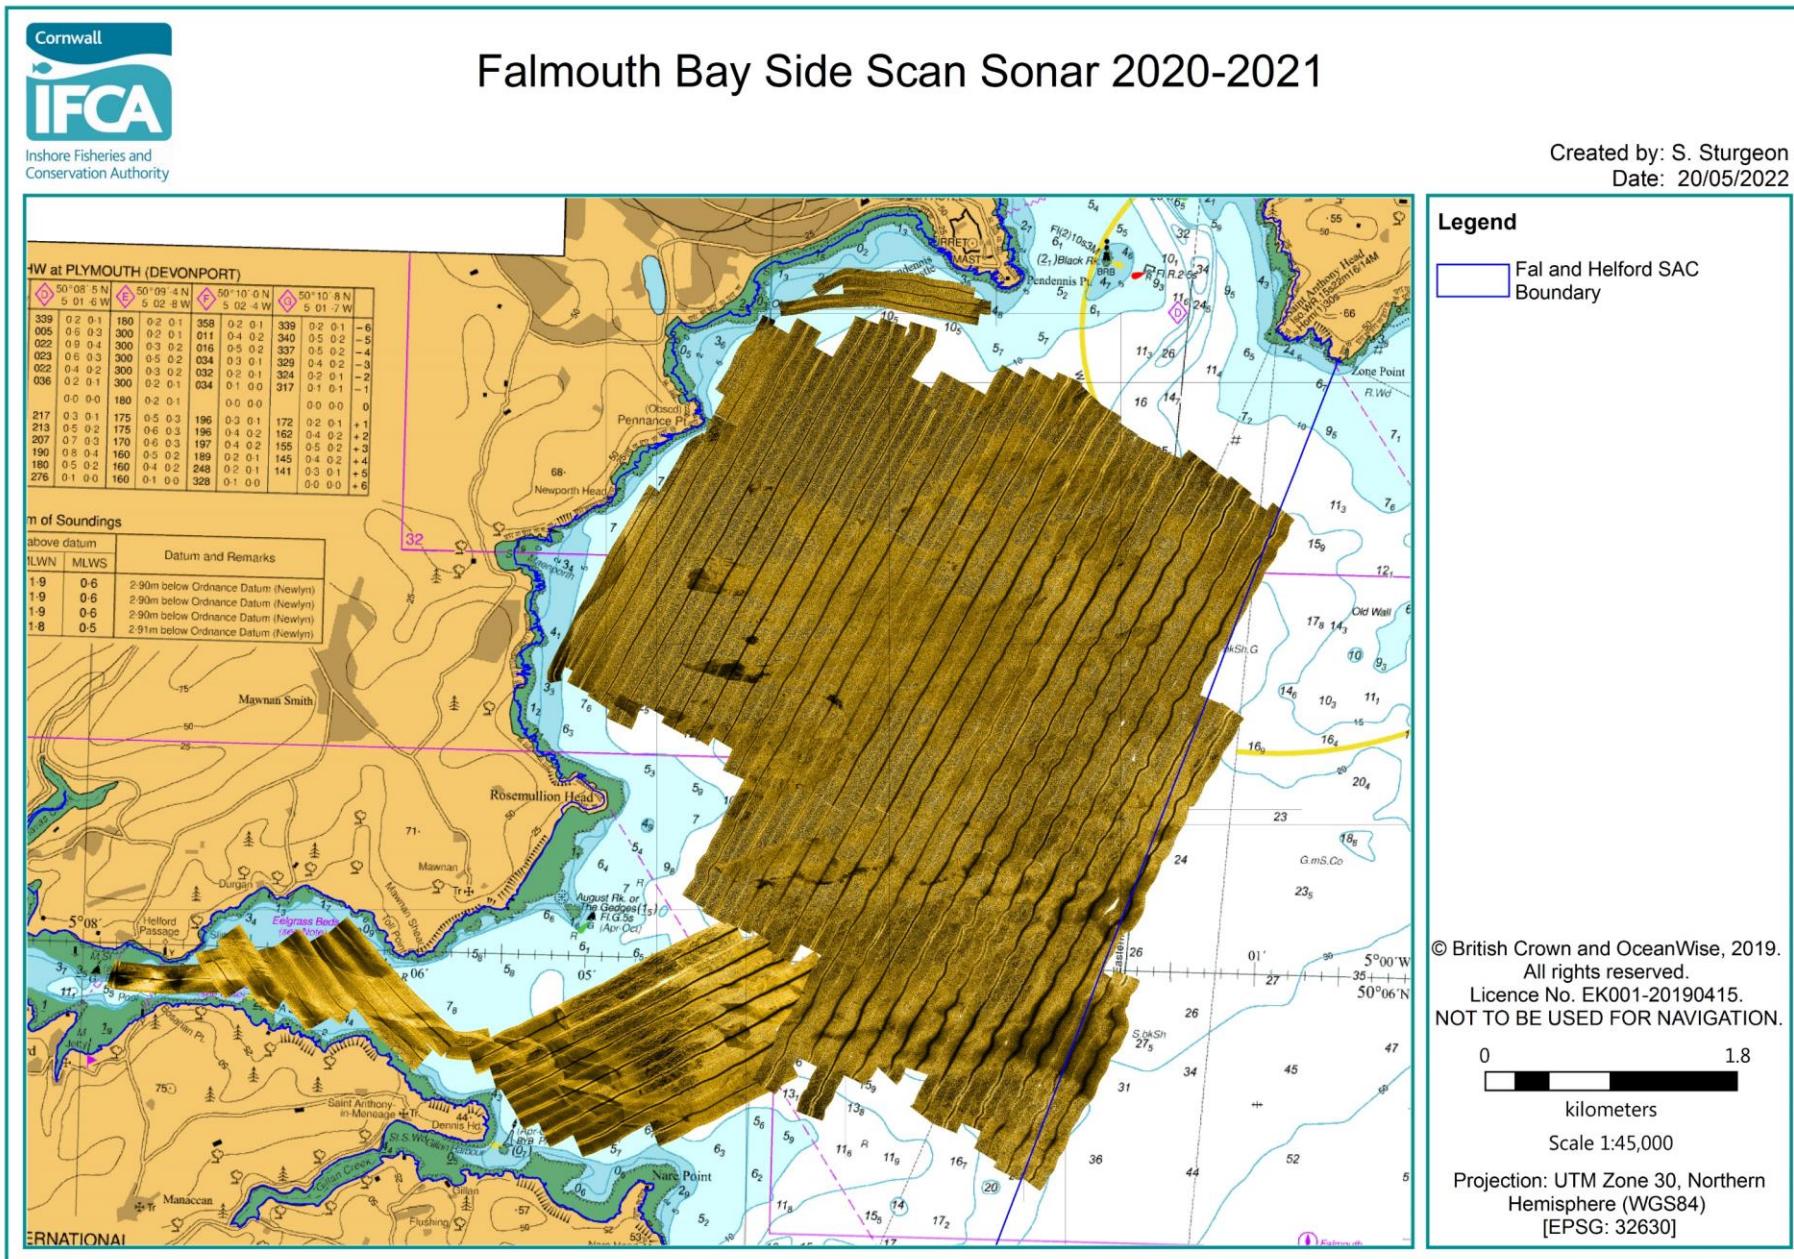

Figure 1: Side scan sonar survey completed within Falmouth Bay using an EdgeTech 4200 side scan sonar by Cornwall IFCA in 2020 to 2021

## CIFCA\_SAC\_FAH\_2022\_DDV\_Maerl\_FieldReport

The interaction of potting on the maerl feature was categorised as amber. An amber interaction is defined as “Where there is doubt as to whether conservation objectives for a feature (or sub-feature) will be achieved because of its sensitivity to a type of fishing, in all EMSs where that feature occurs, the effect of that activity or activities on such features will need to be assessed in detail at a site specific level. Appropriate management action should then be taken based on that assessment”. Activity/feature interactions identified within the matrix as amber risk require assessment to determine whether management of an activity is required to conserve site features.

Maerl beds have previously been assessed as having a high sensitivity to heavy potting activity, medium sensitivity to moderate levels of potting and low sensitivity to light and single use potting (Hall *et al.*, 2008). The levels were defined as;

- Heavy — Lifted daily, more than five pots per hectare (i.e. 100m by 100m) (equivalent to over 182,500 pot hauls per km<sup>2</sup> per year);
- Moderate — Lifted daily, two to four pots per hectare (equivalent to 73,000–182,500 pot hauls per km<sup>2</sup> per year);
- Light — Lifted daily, less than two pots per hectare (equivalent to less than 73,000 pot hauls per km<sup>2</sup> per year); and
- Single — Single accidental fishing event of a string.

The assessment aimed “to assess habitat sensitivity to fishing by comparing the severity of a fishing event against the rate of habitat recovery to derive a habitat sensitivity score (high, medium or low)” (Hall *et al.*, 2008). The sensitivity assessment result is based on the fact that maerl is fragile and is highly sensitive to damage from any source (Hall-Spencer, 1998) as it takes a very long time to recover (Walmsley *et. al.*, 2015) due to having slow growth rates of around 1-2mm per year (Perry and Jackson, 2017).

The Natural England conservation advice describe the Fal and Helford SAC maerl bed feature as (Natural England, 2021);

“the largest outside of Scotland, Brittany or Ireland. The Fal and Helford maerl bed habitats range from pristine live maerl beds with up to 100% coverage to extensive areas of dead maerl with little to no live maerl. Two species of maerl occur on the site including the nationally scarce *Lithothamnion coralliooides* and *Phymatolithon calcareum*.

The live maerl bed at St. Mawes is the largest and probably best known maerl habitat within the SAC. The large bed to the northwest and the smaller bed to the west of Castle Point are dominated by *L. coralliooides* with a smaller area of *P. calcareum* found in the centre of the larger, northwest bed (Allen *et al.*, 2014; Howson *et al.*, 2004). Live maerl is also found in a large bed at Helford Passage (Gall, 2014) and throughout Falmouth Bay and Carrick Roads (Allen *et al.*, 2014).

There are extensive areas of dead and crushed maerl, and living maerl overlaying dead maerl found within the site (Allen *et al.*, 2014; Howson *et al.*, 2004), as well as an area of maerl in sediment. These areas of mixed maerl and sediments are comprised of maerl fragments combined with various sediment types including coarse sand,

## CIFCA\_SAC\_FAH\_2022\_DDV\_Maerl\_FieldReport

fine sediment, shells and stones. In places, expanses of maerl in sediment form small undulations on the sea floor (Scottish Natural Heritage (SNH), 1994).

Over fifty species of seaweed and many animal species associated with maerl habitats have been recorded at the site, including rarely recorded species such as the red algae *Gracilaria multipartita* and *Halymenia* species, and Couch's goby *Gobius couchi*. Maerl sediments provide important habitat for a range of species including deep burrowing species, attached seaweed, bivalves and crustaceans (Moore *et al.*, 1999). Infaunal core samples from dead maerl in the Outer Carrick Roads recorded in excess of 230 taxa at genus level (Posford Haskoning, 2004), highlighting that both live and dead maerl habitats support diverse communities”.

The 2020 condition assessment found the maerl bed feature to be in unfavourable – declining condition (Table 1). The drivers for the feature condition are historical aggregate extraction, water quality, both recreational and commercial anchoring and mooring (Natural England, 2020).

## Condition Assessment: (Natural England, 2020)

Table 1: The Natural England condition assessment for maerl (Natural England, 2020).

Feature	Sub feature name	Assessment date	Feature condition	Confidence
H1130 Estuaries	A5.51 - Maerl beds	02/03/2020	Unfavourable - Declining	High
H1160 Large shallow inlets and bays	A5.51 - Maerl beds	02/03/2020	Unfavourable - Declining	High
H1110 Sandbanks which are slightly covered by sea water all the time	A5.51 - Maerl beds	02/03/2020	Unfavourable - Declining	High

Pressures that potting on the maerl habitat could cause as advised as ‘Sensitive’ by Natural England in the Advice on Operations for the site are (Natural England, 2022);

- Abrasion/disturbance of the substrate on the surface of the seabed
- Removal of non-target species
- Deoxygenation
- Introduction of light
- Introduction or spread of invasive non-indigenous species (INIS)
- Organic enrichment
- Penetration and/or disturbance of the substratum below the surface of the seabed, including abrasion

Historic survey data detailing maerl positions in the Fal and Helford SAC was collated to help identify suitable survey locations for the current survey (Figure 2). Historic data was downloaded from EMODnet and included EUNIS points, Broad-scale habitat (BSH) points and BSH polygons. Such historic surveys have frequently categorised any maerl present, whether live or dead, as a ‘maerl bed’. Cornwall IFCA officers believe that live maerl beds and dead maerl gravel should be considered separately due to the structure (2D/ 3D), mobility, substratum and species present. This issue was raised with Natural England during a regular catch up meeting on 4<sup>th</sup> June 2020. A categorisation system for maerl bed habitats in England was produced by Natural England (Axelsson, 2022).

### 1.1 Aims & Objectives

#### 1.1.1 Aims

- To update the extent and distribution of maerl habitats within Falmouth Bay.

#### 1.1.2 Objectives

- Collect high quality video and still imagery from 25 sites within the Fal and Helford SAC using the mapping European seabed habitats recommended operating guidelines for underwater video surveys (Coggan, 2007).
- Collect high quality video and still imagery of habitat transitions within the Fal and Helford SAC.
- Verify side scan sonar signatures from imagery collected during the survey.
- Map the distribution of the different maerl habitats using the Natural England maerl categorisation.

## 2 Methodology

---

### 2.1 Survey Area

The survey was carried out within the Fal and Helford SAC on the south coast of Cornwall (Figure 2).

### 2.2 Survey sites

A total of 25 survey sites were planned as shown in Figure 3.

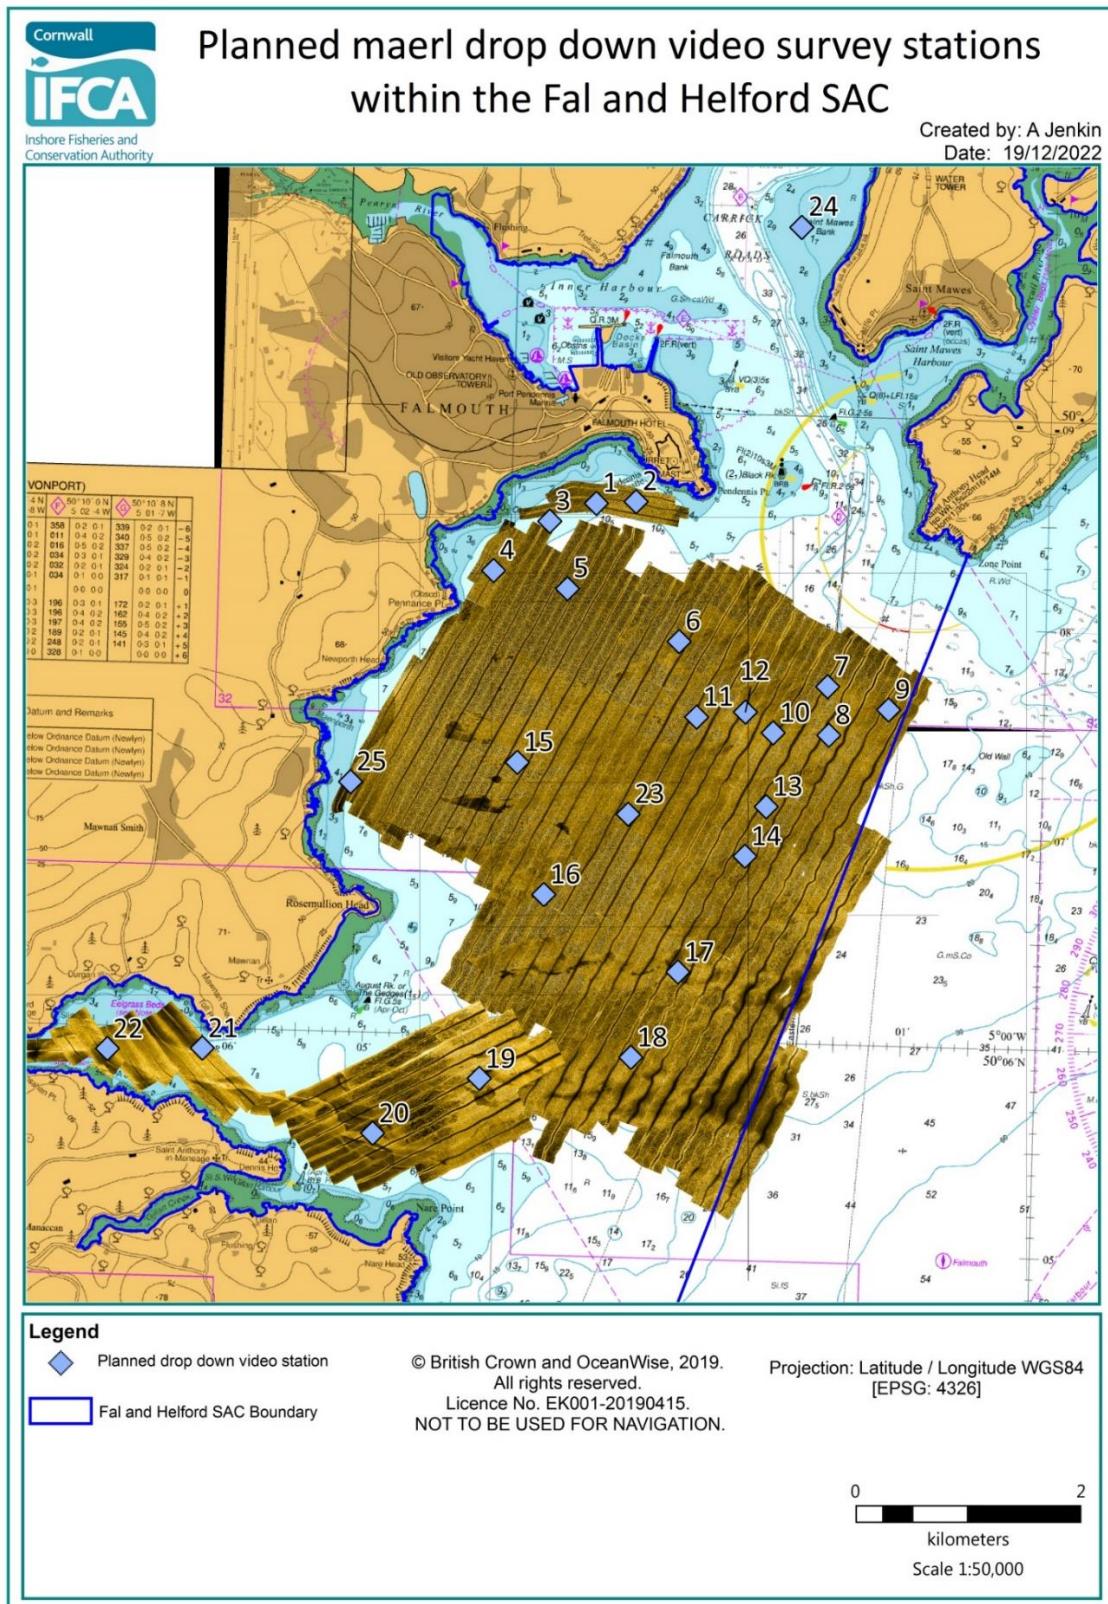

Figure 3: Planned survey sites for the Cornwall IFCA drop down video maerl survey within the Fal and Helford Special Area of Conservation (SAC)

### 2.3 Vessel Specifications

Research vessel (R/V) Tiger Lily VI is Cornwall IFCA's survey vessel (Figure 4) and was used as the platform for this survey. She is a South Boats 11 m Island MkII catamaran with twin IVECO 450hp engines; her Callsign is MRWR7. The general layout of Tiger Lily VI is shown in Appendix 1.

## CIFCA\_SAC\_FAH\_2022\_DDV\_Maerl\_FieldReport

Tiger Lily VI has been refitted for survey work and includes a purpose built survey station within the wheelhouse, fitted with an uninterrupted power supply (UPS) and a dedicated Global Positioning System (GPS) with NMEA outputs.

Figure 4: R/V Tiger Lily VI – Cornwall IFCA's survey vessel.

### 2.4 Personnel

The crew during the survey days consisted of one Principal Scientific Officer, two Scientific Officers and an independent skipper onboard. The crew roles consisted of operating the stills camera and video, running software Hypack, survey logs and operating the winch. Three visitors from the University of Exeter were present during the survey over two of the three survey days.

### 2.5 Personal Protective Equipment (PPE)

Life jackets with personal location beacons (PLBs) and steel toe capped waterproof boots were worn while working on deck. During periods of rain and wind, waterproofs were worn. Hard hats were worn during deployment and recovery of the camera frame. There were no reported accidents or near misses during the survey.

### 2.6 Survey methodology

Video and digital still imagery was acquired using a STR SeaSpyder drop camera system (Appendix 2). The survey was carried out in line with Mapping European Seabed Habitats (MESH) recommended operating guidelines for underwater video and photographic imaging techniques (MESH, 2008).

The tows were planned at 200 m with a still image every 10 m at a speed of 0.5 knots aiming for 10 to 15 minutes per tow. Planned survey sites were loaded into Hypack Max Version 2019 for navigation purposes with 10 10 m radius rings around each site with the aim of having one still image at each ring. If the tide or wind moved the vessel off course a 10 m radius ring was added to each target so the officer would know when the vessel had moved 10 m.

## CIFCA\_SAC\_FAH\_2022\_DDV\_Maelr\_FieldReport

Prior to the deployment of the SeaSpyder for each tow, the video text overlay was checked and adjusted to display the survey name and tow number (e.g. "Cornwall IFCA\_01/06/2022. Fal Bay\_DDV\_02\_T1") and the GPS, heading and depth info was checked to ensure that it was updating correctly. The .jpeg file name prefix was checked and adjusted to display the survey name, tow number, date, time (UTC) and automatic image number (e.g. "CIFCA\_FalBay\_02\_T1\_20220601\_\_14\_23\_20\_0094.JPG"). The SeaSpyder camera was deployed through the A-Frame at the stern of Tiger Lily and lashed securely to the starboard side of the vessel between tows.

The video was set to record once the camera was just above the seabed. Com Port A was set to log to record all positional information from the USBL GPS antenna (Lat/ Long WGS84) for the entire tow. A target was created in Hypack to indicate the start of line (SOL); this was repeated at the end of line (EOL). The SeaSpyder was 'flown' with the frame legs just above the seabed for the tow. The camera frame was landed on the seabed every 10 m for a still image to be captured. Image separation varied slightly to ensure that the stills taken were of good quality (e.g. taken when the camera was focused on the seabed and the lens unobstructed) this sometimes led to a delay. Immediately upon having captured a still image a target was created in Hypack. Field notes were recorded for each target in Hypack such as image number, speed over ground and real-time observations of substrate and taxa (comma delimited) when possible.

For vessel and equipment specifications see Appendix 1 and Appendix 2.

### 2.7 Data handling

Hypack targets were used in data processing to obtain the exact time of each still image and the Easytrak Alpha USBL GPS log was used to obtain the exact location of each still image. All position information was recorded in the Lat/Long WGS84 projection and taken from a single GPS (USBL GPS antenna). GPS targets were recorded using the USBL GPS antenna set up on the wheelhouse roof of Tiger Lily. Hypack was set up to log a vessel position recorded every second and the Com Port A file was recording the USBL position from the camera for the duration of each tow. Hypack targets were extracted as a .txt file format and opened in Microsoft Excel (comma delimited). The Hypack 'logging' function was left running both survey days which outputs as a .RAW file. This data was opened with Microsoft Excel and cut to only include relevant strings of data such as date, time, position and depth. The data has not been extracted per tow but is available if required. Com Port A data was logged for the duration of each tow and saved in a .txt file format to the Topside PC.

Still images from the SeaSpyder camera were initially stored on the internal computer (sub-surface), then on completion of each tow the still images were transferred to the SeaSpyder topside control unit using FileZilla and filed by site number. Video files were captured to the SeaSpyder topside unit data drive (D:/). The stills and video files were transferred from the topside unit to a WD Passport for transport and storage at the end of each survey day. The log sheets were worked on from the network and saved regularly throughout the day.

## 2.8 Data analysis

Image analysis was carried out post-survey with each still image being assessed in terms of quality with categories good, acceptable or poor as follows;

- Good: Clear, camera on seabed and sediment type and fauna distinguishable
- Acceptable: Can make out the sediment type and what fauna are present but not the best quality
- Poor: Can't make out the sediment type or what fauna is present

Any poor-quality images were not carried forward for further analysis.

The position data for each tow were transferred to MapInfo Professional Version 17.0.2 and points were created to show the position of each still image (good and acceptable quality images only) and SOL/ EOL positions.

## 3 Results

---

### 3.1 Cruise Narrative

All times are Universal Time Coordinated (UTC).

#### 21<sup>st</sup> March 2022

R/V Tiger Lily departed Mylor at 10:00 on the 21/03/2022 with three Scientific Officers, an independent skipper and one member of staff from the University of Exeter on board. The vessel transited to St Mawes Bank first and the camera was deployed at 10:12. The visibility was too poor to collect good quality stills or video. The vessel then transited to the Exclusion Zone within the Fal Fishery and the camera was deployed at 10:39 to check if the visibility was any better at a different location. The visibility was too poor to collect good quality stills or video.

The vessel returned to Mylor at 11:00 to drop off the guest and returned to the River Fal to trial the USBL beacon.

#### 12<sup>th</sup> May 2022

R/V Tiger Lily departed Mylor at 08:20 on the 12/05/2022 with three Scientific Officers and an independent skipper. The vessel transited to the first site and the camera was deployed at 08:25. A total of ten tows were completed, obtaining 02:27:49 of video and 207 still images pre-QC (Table 2). The time and position on the video for Sites 08, 11, 06 and 05 was set to update at two second intervals.

Seaweed was stuck on the camera during the last tow which was finished early due to restricted visibility. The camera was recovered to deck by 15:33 and Tiger Lily departed for Mylor, arriving alongside at 17:15.

#### 1<sup>st</sup> June 2022

R/V Tiger Lily departed Mylor at 07:50 on the 01/06/2022 with two Scientific Officers onboard, one whose role was skipper. Two students from the University of Exeter were also onboard. The vessel transited to the first site and the camera was deployed at 08:25. A test run was carried out initially to show the students how the equipment operates. A total of five tows were completed, obtaining 02:17:22 of video and 93 still images pre-QC (Table 3).

The camera was recovered to deck by 14:35 and Tiger Lily departed for Mylor, arriving alongside at 15:02.

#### 13<sup>th</sup> July 2022

## CIFCA\_SAC\_FAH\_2022\_DDV\_Maelr\_FieldReport

R/V Tiger Lily departed Mylor at 06:20 on the 13/07/2020 with three Scientific Officer and an independent skipper on board. The vessel transited to the first site and the camera was deployed at 07:45. A total of 12 tows were completed. obtaining 03:22:53 of video and 293 still images pre-QC (Table 4).

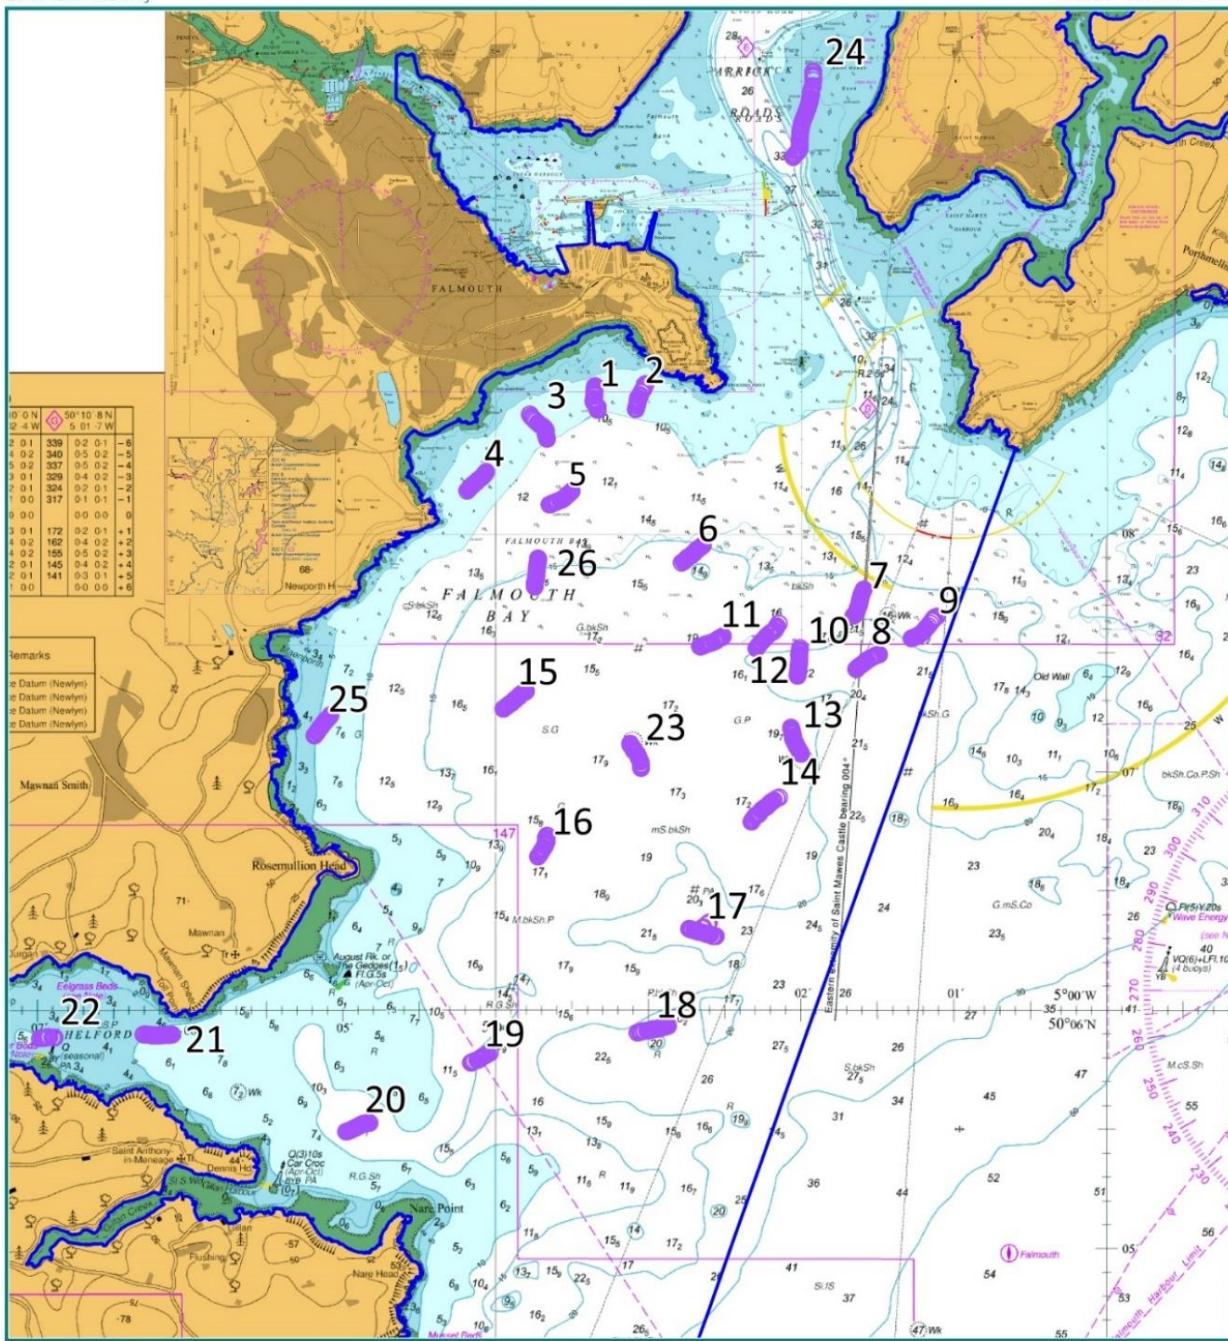

The time and position did not update on the video overlay at Site 19 so the tow was finished after 16 images were captured. This is likely to be due to the location of the tow causing the vessel to loose GPS. One of the tows at Site 17, was a repeat. The camera was recovered to deck by 15:36 and Tiger Lily departed for Mylor, arriving alongside at 16:20.

High definition video footage and digital still images of the seabed (with scaling lasers and dedicated lighting) was acquired, using the downward facing camera, at 26 sites (Figure 5). One additional site was completed in addition to the 25 planned sites.

The daily logs are shown in Appendix 3. Tow information including still image and video position are summarised in Appendix 4.

#### 4 Discussion

The survey was successful in verifying different maerl habitats using high quality still images and video which can be used to verify habitat types represented by the given acoustic signal. Full details of the analysis and detailed results are reported on by Jenkin *et al.*, 2023 in the survey report for the 2022 Fal and Helford Drop Down Video Maerl Habitat Survey.

## 6 Appendices

---

### Appendix 1. Vessel specification

#### 6.1 R/V Tiger Lily VI

The survey was undertaken from Cornwall IFCA's Research Vessel (R/V) Tiger Lily VI and vessel specification is shown in Annex Table A. Tiger Lily VI is an MCA coded Cat 2 vessel. The vessel has been refitted for survey work and includes a purpose built survey station within the wheelhouse. All times are recorded as UTC and taken from the same source as the position data. The clocks on all of the data capture PCs were synched prior to departing the vessel's mooring.

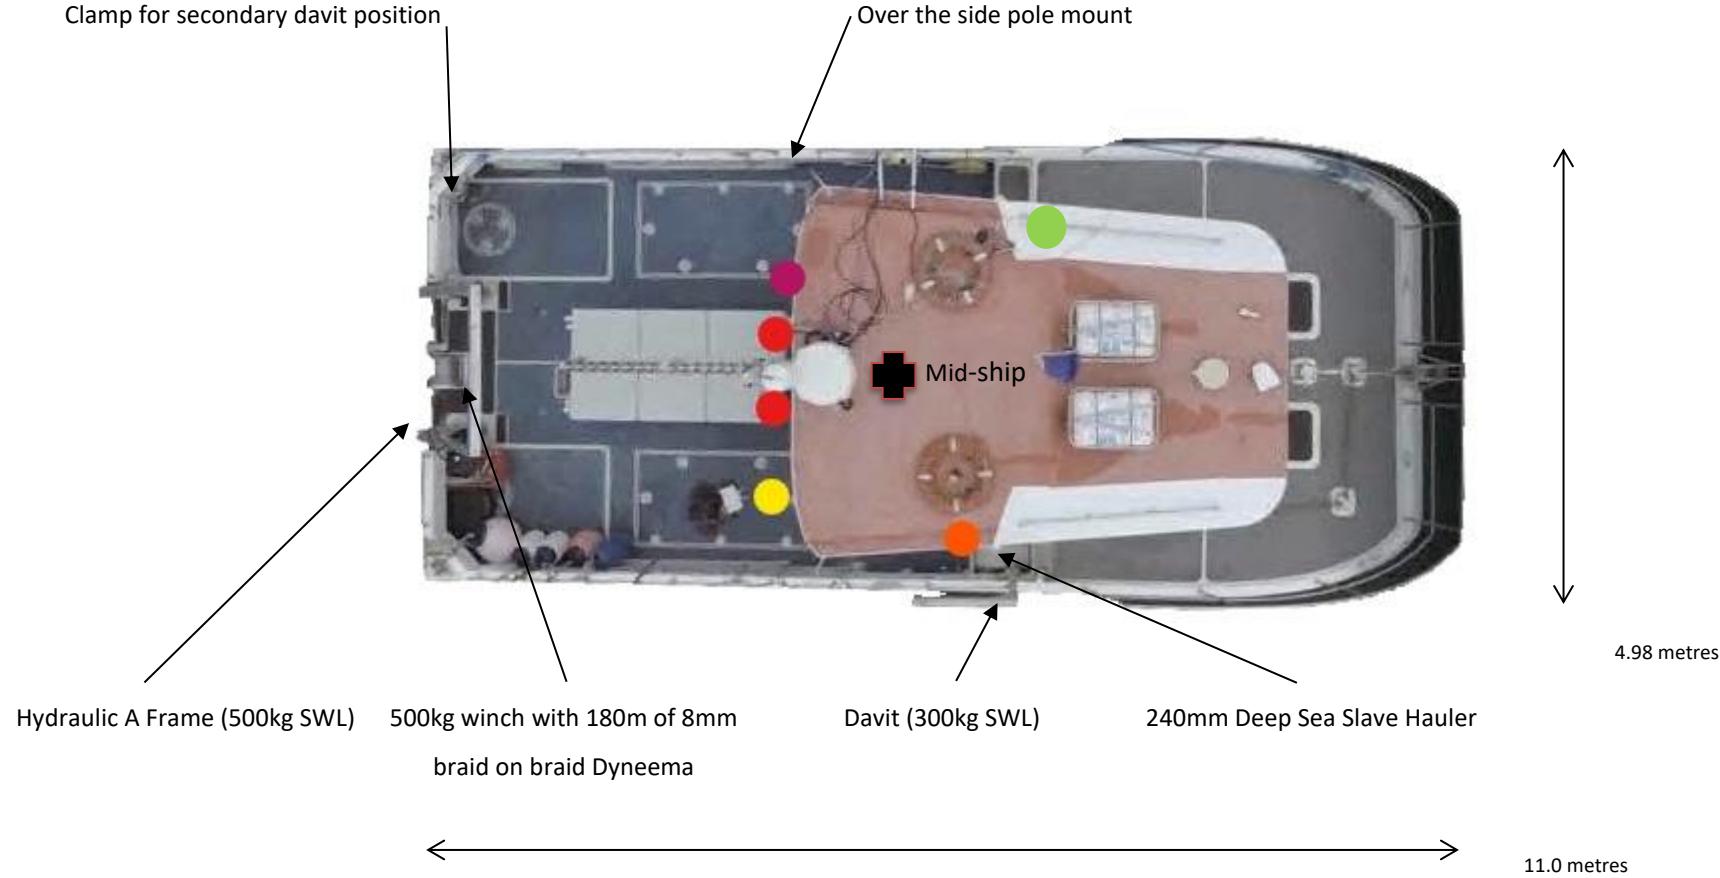

Annex Table A: Research Vessel Tiger Lily VI Vessel Specification

Builder	South Boats Ltd	
Model	Island MkII	
Built	2007	
LOA	11.0m	
Beam	4.98m	
Draught	1.1m (aft)	
Tonnage	c.10 tonnes	
Area of operation	MCA Category 2	
Call sign	MRWR7	
MMSI Number	235054954	
MECAL number	Certification	M07WB0111059
Complement	14 (including min 2 crew)	
Propulsion	2 x 450hp Iveco NEF series	
Speed	Cruising: 16 – 18 knots Top: 24 – 26 knots	
Range	c. 400 nautical miles	
240v AC supply	Victron 3Kw power inverter 5KvA Volvo-Perkins generator (All 240 AC power is accessed via APC Smart UPS C1500)	
Stern Gantry	500kg SWL	
Winch (on stern gantry)	Spencer Carter 0.5t with scrolling level wind	
Slave hauler	Sea Winch 200m dia.	
Electric line hauler	12v Spencer Carter Bandit	
Positioning	Hemisphere V500 GNSS 3 x Furuno GP32	
NMEA data outputs	4 x USB 4 x Serial 4 x banjo	
Navigation	Olex with data export Knockle Hypack Max	
Connectivity	SATFI 4G Mobile broadband

### 6.3 STR SeaSpyder drop camera system

Details of the system are available online: <http://www.str-subsea.com/sales/str-SeaSpyder-drop-camera-system>.

Appendix Table A shows the camera system specification and Appendix Figure A**Error! Reference source not found.** shows the camera system on the starboard side of R/V Tiger Lily.

Appendix Table A: SeaSpyder Drop Camera specification

Equipment	Camera System
Manufacturer	Subsea Technology & Rentals Ltd
Video	HD video 600 lines PAL
Stills	18 mega pixels
Height control	Video footage
Lighting	Four high density LED 20w lamps
Image scaling	4 Dual lasers for precise imagery scaling
Shutter control	Remote from deck
Additional info	<ul style="list-style-type: none"> <li>• Full remote control of camera functions including automatic and manual focus control</li> <li>• ‘On-the-fly’ image download</li> <li>• High speed digital telemetry link to camera and sensors</li> <li>• High power underwater flash</li> <li>• Inbuilt compass and depth sensors</li> </ul>

Appendix Figure A: Drop Down Video mounted camera system and frame used onboard R/V Tiger Lily

#### 6.4 Applied Acoustics Easytrak Alpha USBL

Details of the system are available online: <https://www.aaetechnologiesgroup.com/applied-acoustics/products/easytrak-usbl-systems/easytrak-alpha-2665-alpha-portable-2655/>

Appendix Table B shows the USBL system specification.

Appendix Table B: Applied Acoustics Easytrak Alpha USBL specification

<b>Equipment</b>	<b>USBL System</b>
Manufacturer	Applied Acoustics
Model	Easytrak Alpha 2665 Series
Range Resolution	10 cm
Position accuracy	2.0° RMS, 3.5% of slant range. Excluding effects due to GPS error, incorrect VOS, ray bending, compass, pitch and roll effects, and acceptable S/N ratio.
Heading sensor accuracy	<0.5° RMS
Tilt sensor accuracy	Accuracy $\pm$ <1.0° RMS Range $\pm$ 80°
Internal GPS / DGPS	SiRF StarIII Chip set Receiver <10m, 2D RMS <5m 2DRMS, SBAS (WAAS, EGNOS, MSAS...) corrected.

<b>Description of tow (direction/ current/ tides/ overall habitat)</b>						<b>Data recorder</b>	SS	

Fine sediment with sparse dead maerl, transitioned to maerl sediment with live and dead maerl. Time and position not updating on video overlay - likely due to location of tow and no GPS.
