

Solar Heating

We ensure that all our engineers who install solar panels are talented skilled and trained to the highest standards. We want all our customers to feel they received the best level of quality and service from the first contact with our office based booking team and customer service department to the time the engineers install solar panels for you.

If we install solar panels for you we guarantee to provide you an energy efficient system that will decrease your energy bills, which with the ever rising price of fossil fuels could work out as a considerable saving. Another reason to install solar panels is to reduce your carbon footprint, doing your bit for the environment. In other words, if you install solar panels you will reap financial and environmental benefits. When you install solar panels you want to be sure that the product you are receiving is reliable and durable and at Jackman Plumbing you can rest assured that it is.

Another way you will benefit when you install solar panels is that global warming issues and Carbon Dioxide emissions are a priority for the government. This is why if you install solar panels there are grants to contribute to the cost of installation. There is currently a scheme called 'Feed-In-Tariff' and soon to be one launched called 'Renewable heat Incentive'. These schemes are in place to ease the financial strain when you install solar panels.

When you install solar panels you need to be aware that there are two different types and be careful to install solar panels that suit your requirements.

Before you can install solar panels you must pick one of the two options below:

- Solar water heating (Solar Thermal- ST) is where you install solar panels specific for water heating. The sun is used to heat up your hot water to use for baths shower's and hot taps. If you install solar panels in your home (for water) you will find that they will give you approximately half the water your household will need in a year just from solar energy. This type of solar energy has been around for over 30 years and is tried tested and deemed safe so when you install solar panels you know you are installing a reliable and proven renewable energy source.
- Solar electricity, otherwise known as Solar Photovoltaic (PV) comes from combining the two words photo meaning light and voltaic meaning electricity. You would install solar panels in your property which would convert solar energy into useable electricity. Effectively you would install solar panels to generate electricity from light, specifically for the purpose of producing electricity for powering small or low level domestic appliances. To install solar panels will also reduce your dependency on gas and electricity.

To find out about our solar heating installation please ring our customer service department today on **0208 969 2299**.
